ATKearney

Emissions Trading Scheme (ETS): The World's most advanced climate action tool needs to be fixed

European Emissions Trading Scheme ...

- EU has climate action target to reduce CO₂ emissions by 80% until 2050
- Main tool is the ETS: caps CO₂ emissions of the European Industry
- Emissions allowances are traded by companies via online accounts
- Market mechanism should ensure CO₂ avoidance is reached at lowest cost

... is currently not working

Current CO₂ price of 7€/t not enough to trigger investments into a cleaner industry

TheCompensators* is a grass roots way to break the wall of industrial pollution

While politics is not fixing the ETS ...

- EU politics does not take the rigorous measures needed
- Member States such as Poland block attempts of improved climate action

... you can do it yourself

E.g. just buying green electricity does not save CO₂ emissions

You can delete the corresponding EUAs via the ETS account of TheCompensators*

At www.thecompensators.org you can take climate action yourself
